

GET THE MOST OUT OF YOUR ECLIPSE PRO USER GUIDE

- Place the machine in the centre of the room on a table, coffee table height.
- Leave bathroom door open for the ozone to circulate around the room and bathroom. Bathroom to be dry, no wet shower screens / curtains.
- Close the room curtains so the ozone can be absorbed into curtains to remove any odour issues.
- Windows to be closed as ozone will draw to fresh air and effectiveness will weakened
- If the odour is in the carpet, then place the unit on the floor, so the ozone focuses on the area. Ozone is heavier than air and head towards the floor.
- Never place the ozone machine in a damp bathroom on its own, with the door closed. The unit needs dry air to make the ozone. If the client has smoked in the bathroom, please use only when the bathroom has been dried and place the machine in the open door way.
- Operation, plug in the lead into the both the machine and the wall socket. There is a master switch on the rear of the machine. Please switch this on, (lights up green) the lights on the control panel will light up.
- The choose your time selection. The most common time settings are the 30 and 60 minutes setting for removing odours that have recently occurred, such as departing guests who may have smoked. If you are a care home, then 15 minutes in a small bedroom will be deal with lighter odours.
- More historic smells built up over time, may be mustiness, then if time allows, run the machine for 1/2 hours. This will kill any mould spores and slow the growth of mould. Ozone will kill anything airborne, but if the source of the odours is hidden, such as in walls, ozone will keep the odours emitting in check if used on a regular basis, once a week for example.
- Historic odours or strong odours may need two or more treatments to break down the odours spores that may have been absorbed into furnishings etc.
- A fan noise will sound once you start the unit. Ozone production will start. Leave the room. No one to enter the room whilst ozone treatment is in progress.
- The unit has ozone destruct system, so it safe to enter the room after the treatment has finished. The machine will switch itself off once the time selection is finished, switch master switch off and the off at the mains.
- There may be an after smell of ozone, this is normal, it is fresh smell. This will disappear in a few minutes, quicker if the windows are open.
- If you have stubborn odour, then a second treatment may be needed, do as above again.
- If you need to switch the machine off in mid cycle, just push the time setting again, and then turn off mains switch.
